Software for read-out routes and handheld management

*Manual and radio readings*

# TOURMALINE

## Software for read-out routes and handheld management

Tourmaline is a software that enables to manage all of the read-out routes that cover your meter parc. It provides an essential link between your subscriber management and billing software program and your team of meter readers. Tourmaline enables you to accurately monitor the progress of the meter readings' stage.

Tourmaline is designed to import data from your subscriber management (billing) software. This data is then transferred onto handhelds so that meter readers have all the information they need to take their readings as efficiently as possible.

Once the reading stage is complete, all information acquired on the handhelds or on Tourmaline will be retransmitted back to the subscriber management program. Thanks to Tourmaline you can now manage your readings and prepare the work of your meter readers well in advance. All of your information can even be accessed during the reading period.

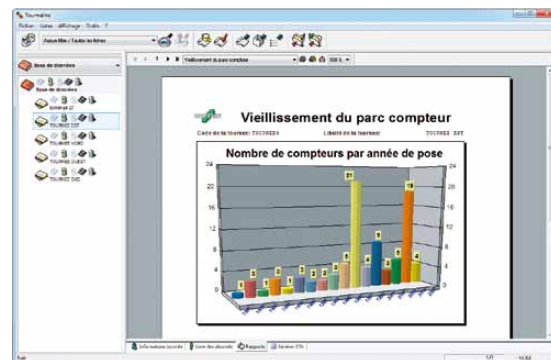

Tourmaline simplifies the way in which you manage your read-out routes using a dynamic, intuitive and secure system. It helps you efficiently manage your meter parc and your subscribers.

Tourmaline has a built-in daily automatic saving system which enables you to restore your data should you experience computer problems.

Tourmaline enables you to view different information received by the radio units installed on the meters. It

has a built-in stock management feature for meters that are pre-equipped with radio units.

With regards to the reports, you can edit the consumption of each subscriber and the summary of the read-out route. They also enable you to view consumption trends using graphical representations. These reports can be printed or saved in various formats (PDF, Excel, etc.).
